THE FIELD EXECUTION COPILOT

See the gap. Know the action. Empower the rep.

One retail visit connects shelf evidence, a stock-aware decision and a human who can act.

Sensing → **Execution** → **Empowerment**

Primary user: the CPG field representative.
Managers review. Buyers approve. Shoppers discover.

EVIDENCE BECOMES A USEFUL NEXT STEP

Real shelf reference · fictional Protiva commercial scenario

Observe → **Verify** → **Save** → **Review**

From an audit result to an accountable visit record.

VISIBILITY NEEDS EXECUTION

The gap survives the technology. The routine must change.

A recent retail study links availability to sensing, execution and frontline empowerment working together.

RETAILIQ DESIGN RESPONSE

Every finding ends in a decision.

Verify stock. Prepare the person. Save an action the next person can inspect.

CORSTEN, GRUEN & LABRECQUE · MAY 2026

~8% out-of-stocks

55 international retailers; grocery and nongrocery consumables. A peer-reviewed survey, not a RetailIQ measurement.

REKIK ET AL. · REVISED JUNE 2026

Audit the stock discrepancy.

A separate working paper reports an 11% sales lift in its audit quasi-experiment, concentrated where system stock exceeded actual stock. About 24,000 SKUs across 11 stores.

An arXiv working paper; not presented as peer reviewed. Its result is not a RetailIQ outcome or forecast.

Sources: Corsten et al., IJRDM (2026) · fieldwork dates absent from the public abstract. Rekik et al., arXiv:2506.05357 · study-specific findings.

ONE PRIMARY WORKFLOW, CONNECTED USERS

The rep acts. People retain the decision.

PRIMARY · CPG FIELD REPRESENTATIVE

A better visit in the aisle.

Capture the shelf, confirm the gap, inspect stock logic, prepare a cited conversation and save the debrief.

User value: less duplicated administration.
Business value: a consistent, reviewable next action.

HUMAN REVIEW · MANAGER AND BUYER

A handoff with evidence.

The field manager inspects visit records and unresolved issues. The authorized buyer reviews counts, terms and proposed orders.

User value: context behind the recommendation.
Business value: commercial control and accountability.

SECONDARY · DIGITAL SHOPPER

Describe a need. Explore options.

Compare available catalogue products by need, price and nutrition. Preferences and basket context guide the conversation.

User value: relevant product discovery.
Business value: a clearer path to a suitable choice.

The application prepares and records a proposed action. It does not place an ERP order or replace the buyer's authorization.

THE DECISIVE EXAMPLE

The shelf is empty. The record says 64 units.

The next step is a stock check and shelf refill. A new purchase needs separate evidence.

Before · fragmented

Photo, spreadsheet, verbal explanation and later debrief leave the discrepancy disconnected.

With RetailIQ · intended workflow

One visit carries the observation, confirmed counts, next action and saved record.

OBSERVED AND CONFIRMED

0 facings

For the assigned product in the guided scenario

INVENTORY RECORD

64 units

System quantity; physical stock still requires checking

ACTION · HUMAN VERIFIES

Locate stock. Reconcile. Fill shelf.

Positive recorded stock is not proof of stockroom availability. Facings and stock units are different measures.

Sense: capture + qualified verdicts	PASS / FAIL / NOT VISIBLE
Execute: confirm + choose next action	Stock check or justified order
Empower: explain + save + review	Rep, manager and buyer

Synthetic example; no achieved stockout reduction is claimed

CODE OWNS THE RETAIL ARITHMETIC

Useful quantities. Visible uncertainty.

Gemini interprets evidence. The application validates the audit and computes the recommendation using retail constraints.

PASS FAIL NOT VISIBLE

Missing visibility is not a pass. Shelf facings never substitute for inventory units.

Own-brand compliance checks eight assigned criteria. The seven-rule competitor benchmark describes observed execution; it does not invent a private competitor plan.

PLANNING LOGIC · SIMPLIFIED

Demand within the planning horizon − usable stock − inbound units

Floor at zero. Apply case rules and shelf-life limits. Display the calculation source.

Demand planning

Forecast-first coverage; labelled trailing-sales fallback when a forecast is unavailable.

Inventory constraints

Inbound netting, case sizes and short-life limits reduce unsupported replenishment.

Evidence boundaries

Frames selected for sharpness. Incomplete views may remain not visible.

Accountability

Context-bound saves and reviewable proposed orders preserve the originating visit.

A PREPARED REP, AN INFORMED SHOPPER

Recommendations with inspectable reasons.

The commercial conversation connects the shelf problem to relevant product facts. The shopper experience uses the same catalogue to make discovery easier.

Rep empowerment

Cited pitch, buyer rehearsal and structured debrief support a better-prepared conversation.

Customer understanding

Segment profiles, preferences and basket context guide which options to discuss.

EXAMPLE · LABELLED SYNTHETIC BRAND EVIDENCE

20g protein at ₹70

The fictional Protiva 200ml fixture supports ₹3.50 per gram of protein. A linked source makes the underlying values inspectable.

Backend cited pitch — Retrieved passages + validated source IDs

Factual pitch text is rendered from the retrieved passages. Published research and synthetic brand evidence stay distinct.

SHOPPER · CONVERSATIONAL DISCOVERY

“Find an available high-protein option.”

Compare catalogue stock, nutrition and prices. Preferences guide the conversation; fixture segments are not measured customer behavior.

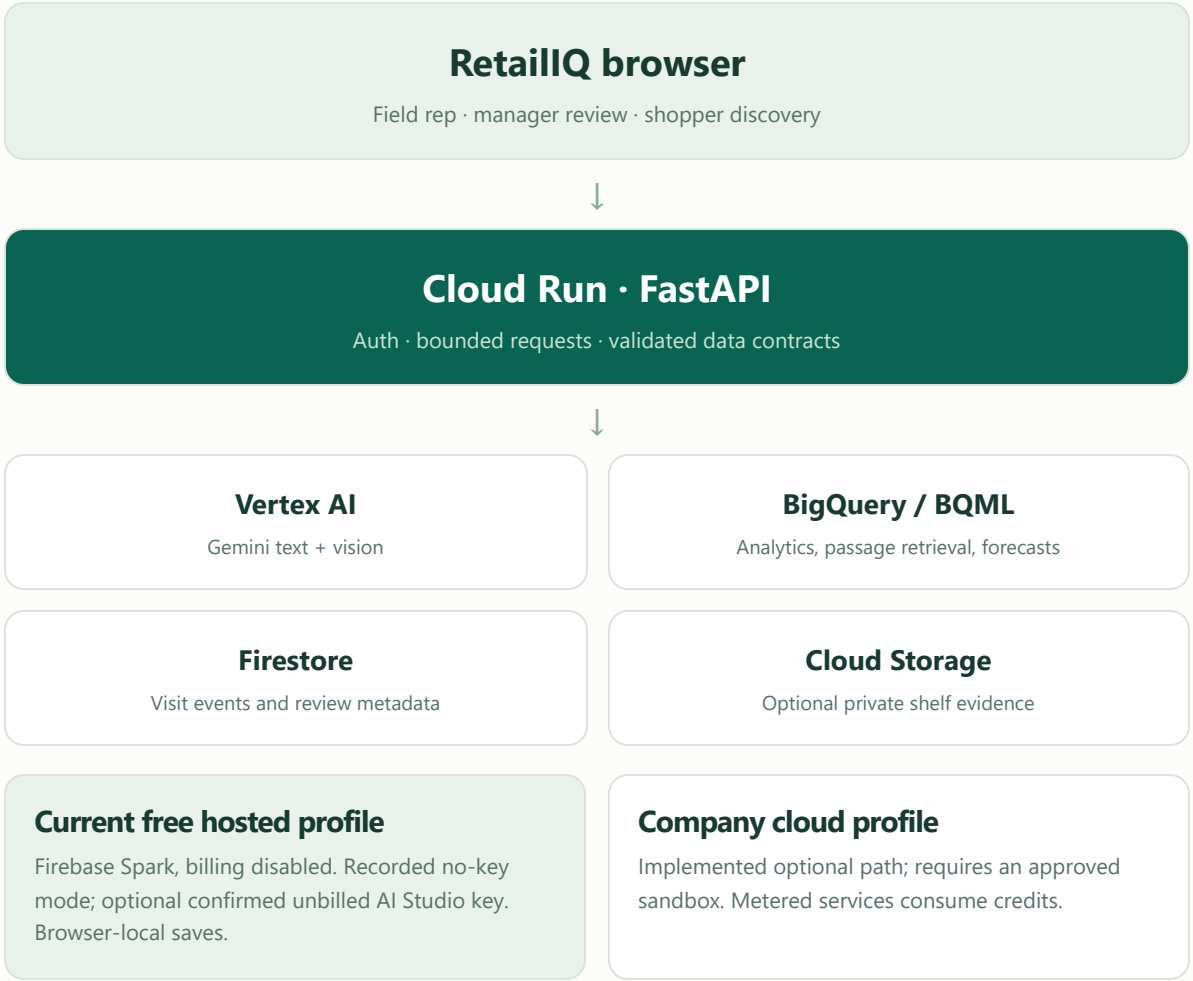

BUILT FOR THE CHALLENGE

One workflow. Clear service roles.

Cloud Run serves the application and API. BigQuery joins commercial context with retrieval and forecasting. Gemini supports text and vision.

Inventory intelligence	Stock, inbound and shelf-life decisions
Demand planning + customer insight	BQML, analytics and segment context
Conversational product discovery	Catalogue-grounded assistance

Private access by default. Explicit shared-demo auth. Optional retained evidence stays private.

ASSUMPTIONS, NOT MEASURED RESULTS

Put a value on productive time.

154 hours/month capacity

10 reps × 6 visits/day × 22 days	**1,320 visits**
Scoped task: 12-minute baseline → 5-minute target	**7 min/visit**
154 hours × assumed ₹300/hour	**₹46,200**
Target ₹5/visit operating budget	**₹6,600**
Illustrative net capacity value	**₹39,600/month**

Scope: audit preparation and debrief administration. Not the entire visit. All inputs require pilot measurement.

Cost profile	What it means
Local / Firebase Spark	Recorded mode makes no AI requests. Unbilled static hosting is quota bounded; billing stays disabled. Saves remain in the browser.
Optional free AI	Use an unbilled AI Studio project with available quota. Quota exhaustion stops requests; no paid fallback.
Company credits	Cloud Run, Vertex AI, BigQuery and storage are metered. Usage consumes credits. Actual credit balance and total cost remain unverified.

Capacity is not guaranteed cash saving. Value depends on how released time is used. Implementation, integration, training and devices are excluded.

The operating budget is a design target, not an invoice. No measured sales or revenue uplift is included in this calculation.

A WORKING PROTOTYPE, BOUNDED CLAIMS

Checks that fail when the behavior is wrong.

Local regressions test software behavior. Historical cloud tests establish a narrower reference. Neither establishes business uplift.

18 current hosting checks passed

Asset hashes, private-path rejection, mobile fit and zero AI/backend requests.

The current optional free-tier model has not been live-evaluated. The free static host does not run the cloud backend. Historical reference results must not be relabelled as current deployment proof.

Credential-free JSON reports are included in **submission/evidence/**.

157 + 7

Browser + policy checks

Context isolation, safe rendering, workflow saves, mobile layout and free-only rules.

60

Python checks

51 API, four deployment doubles and five free-hosting safety checks.

38

Evaluator assertions

Reject wrong facts, arithmetic, citations and false certainty. No model calls.

10 / 10

Historical model cases

Paid Vertex reference, Gemini 3.6 Flash; canonical synthetic cases only.

Historical cloud reference: 22 checks passed

Warehouse, saved visits, authenticated private photos and protected endpoints. Personal-project endpoint now retired.

Synthetic forecast holdout: 7 days, 1.249% WAPE vs 2.824% seasonal baseline. Diagnostic only; not real-store forecast accuracy.

PROVE THE COMPLETE LOOP

Capture evidence. Close the action. Measure the value.

Compare a documented two-week baseline with an assisted period. Start with the rep's scoped audit and debrief task.

REVIEW NOW

Open the free guided demo →

Watch the 3:42 creator-voice submission video →

AI-assisted narration · recorded scenario · synthetic commerce data · no AI calls

retailiq-free-20261018-7ce297.web.app
Firebase Spark · unbilled project · browser-local saves

Source repository: AI-BUILDER-CUP-2026 →

01 Time and usability

Test the five-minute scoped-task target. Measure completion, corrections and productive reuse of released time.

02 Correct decisions

Independent shelf labels; audit precision and abstention. Confirm stock discrepancies before recommending a purchase.

03 Accountable execution

Named human review, saved evidence and follow-through. Track discrepancy closure and recommendation waste risk.

04 Business and operating cost

Observe cost per completed workflow, inference latency and accepted actions. Compare with planning assumptions.

Success means a faster, correct action with evidence a colleague can inspect. Sales uplift and stockout reduction still require operational proof.
